# Time-series Modeling, Analysis, Interface, and Insight from Entomological Electropenetrography

## Auburn-USDA

**Team:** Zachary Traul (TL-S),  
Devanshi Guglani,  
Milo Knell,  
Lillian Vernooy,  
Mehrezat Abbas (TL-F)

**Advisor:** Prof. Gabriel Hope

**Liaisons:** Dr. Elaine Backus (USDA),  
Dr. Anastasia Cooper (Auburn),  
Dr. Kathryn Reif (Auburn)

# Outline

- 01 Background
- 02 Project Goals
- 03 Accomplishments
- 04 Future Work

Aphid

Sharpshooter

Mosquito

Pierce's Disease caused by Sharpshooters  
(University of California)

Aphid

Sharpshooter

Mosquito

We can't directly observe what the mouthparts are doing

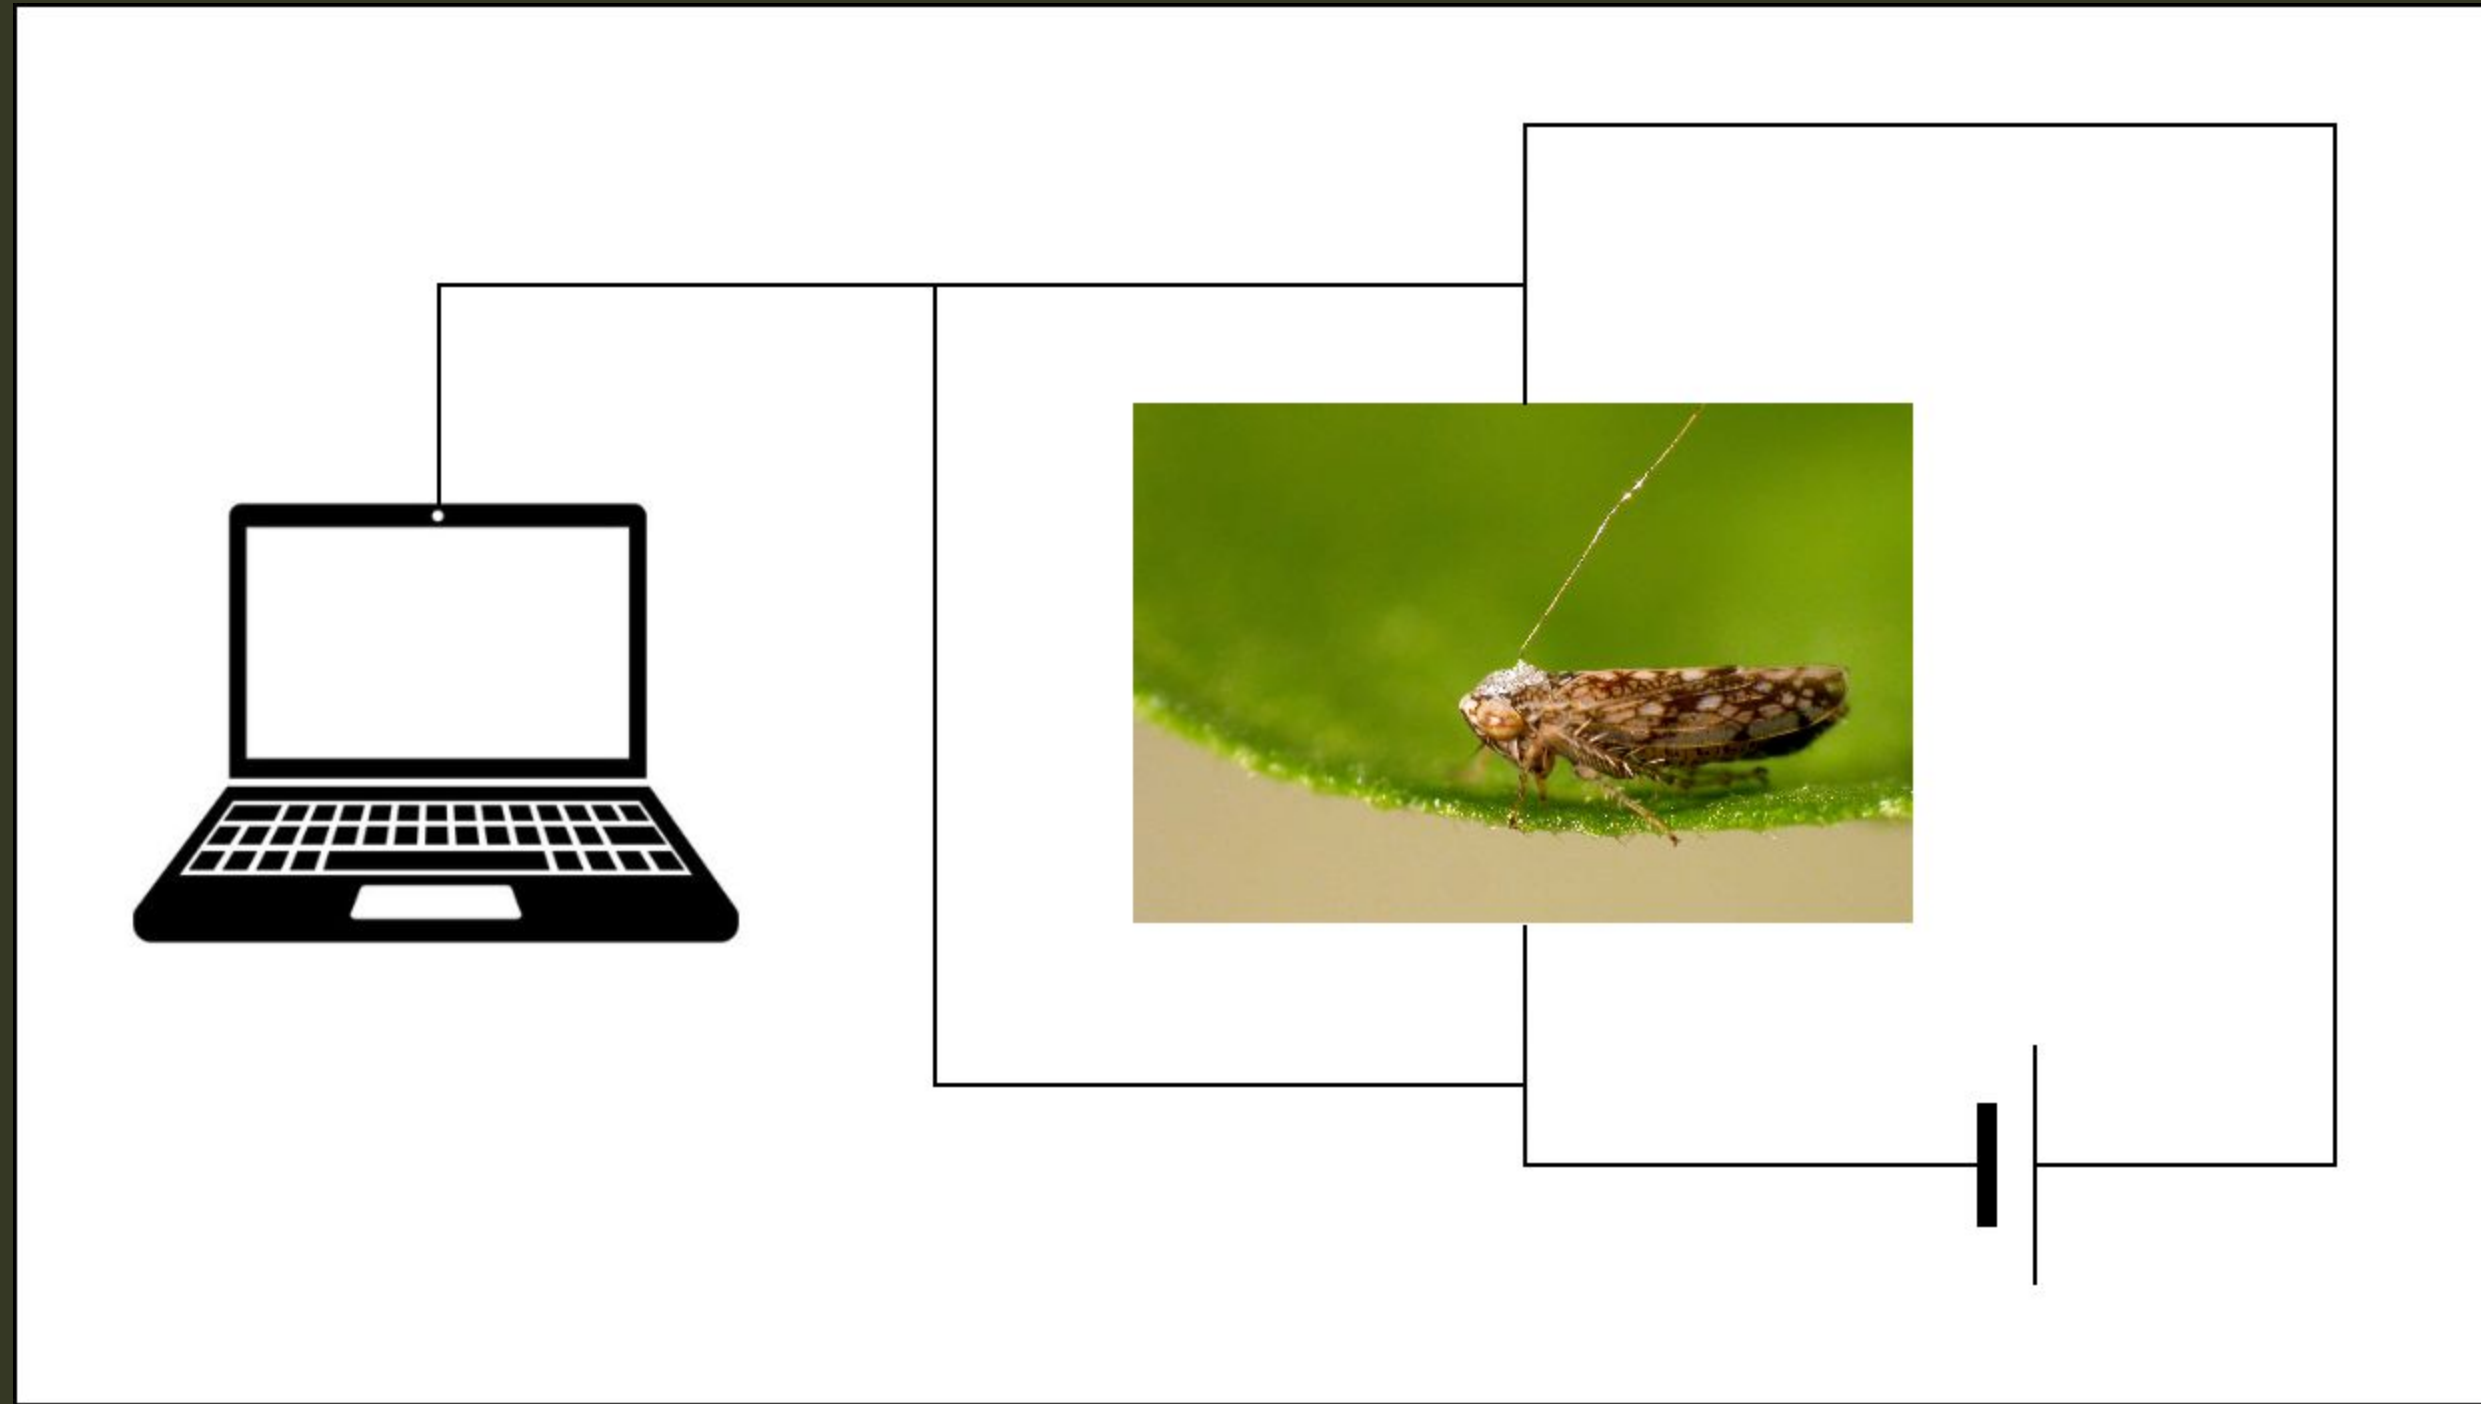

---

# Electropenetrography (EPG)

Leafhopper ready for EPG

EPG Circuit

EPG Recording

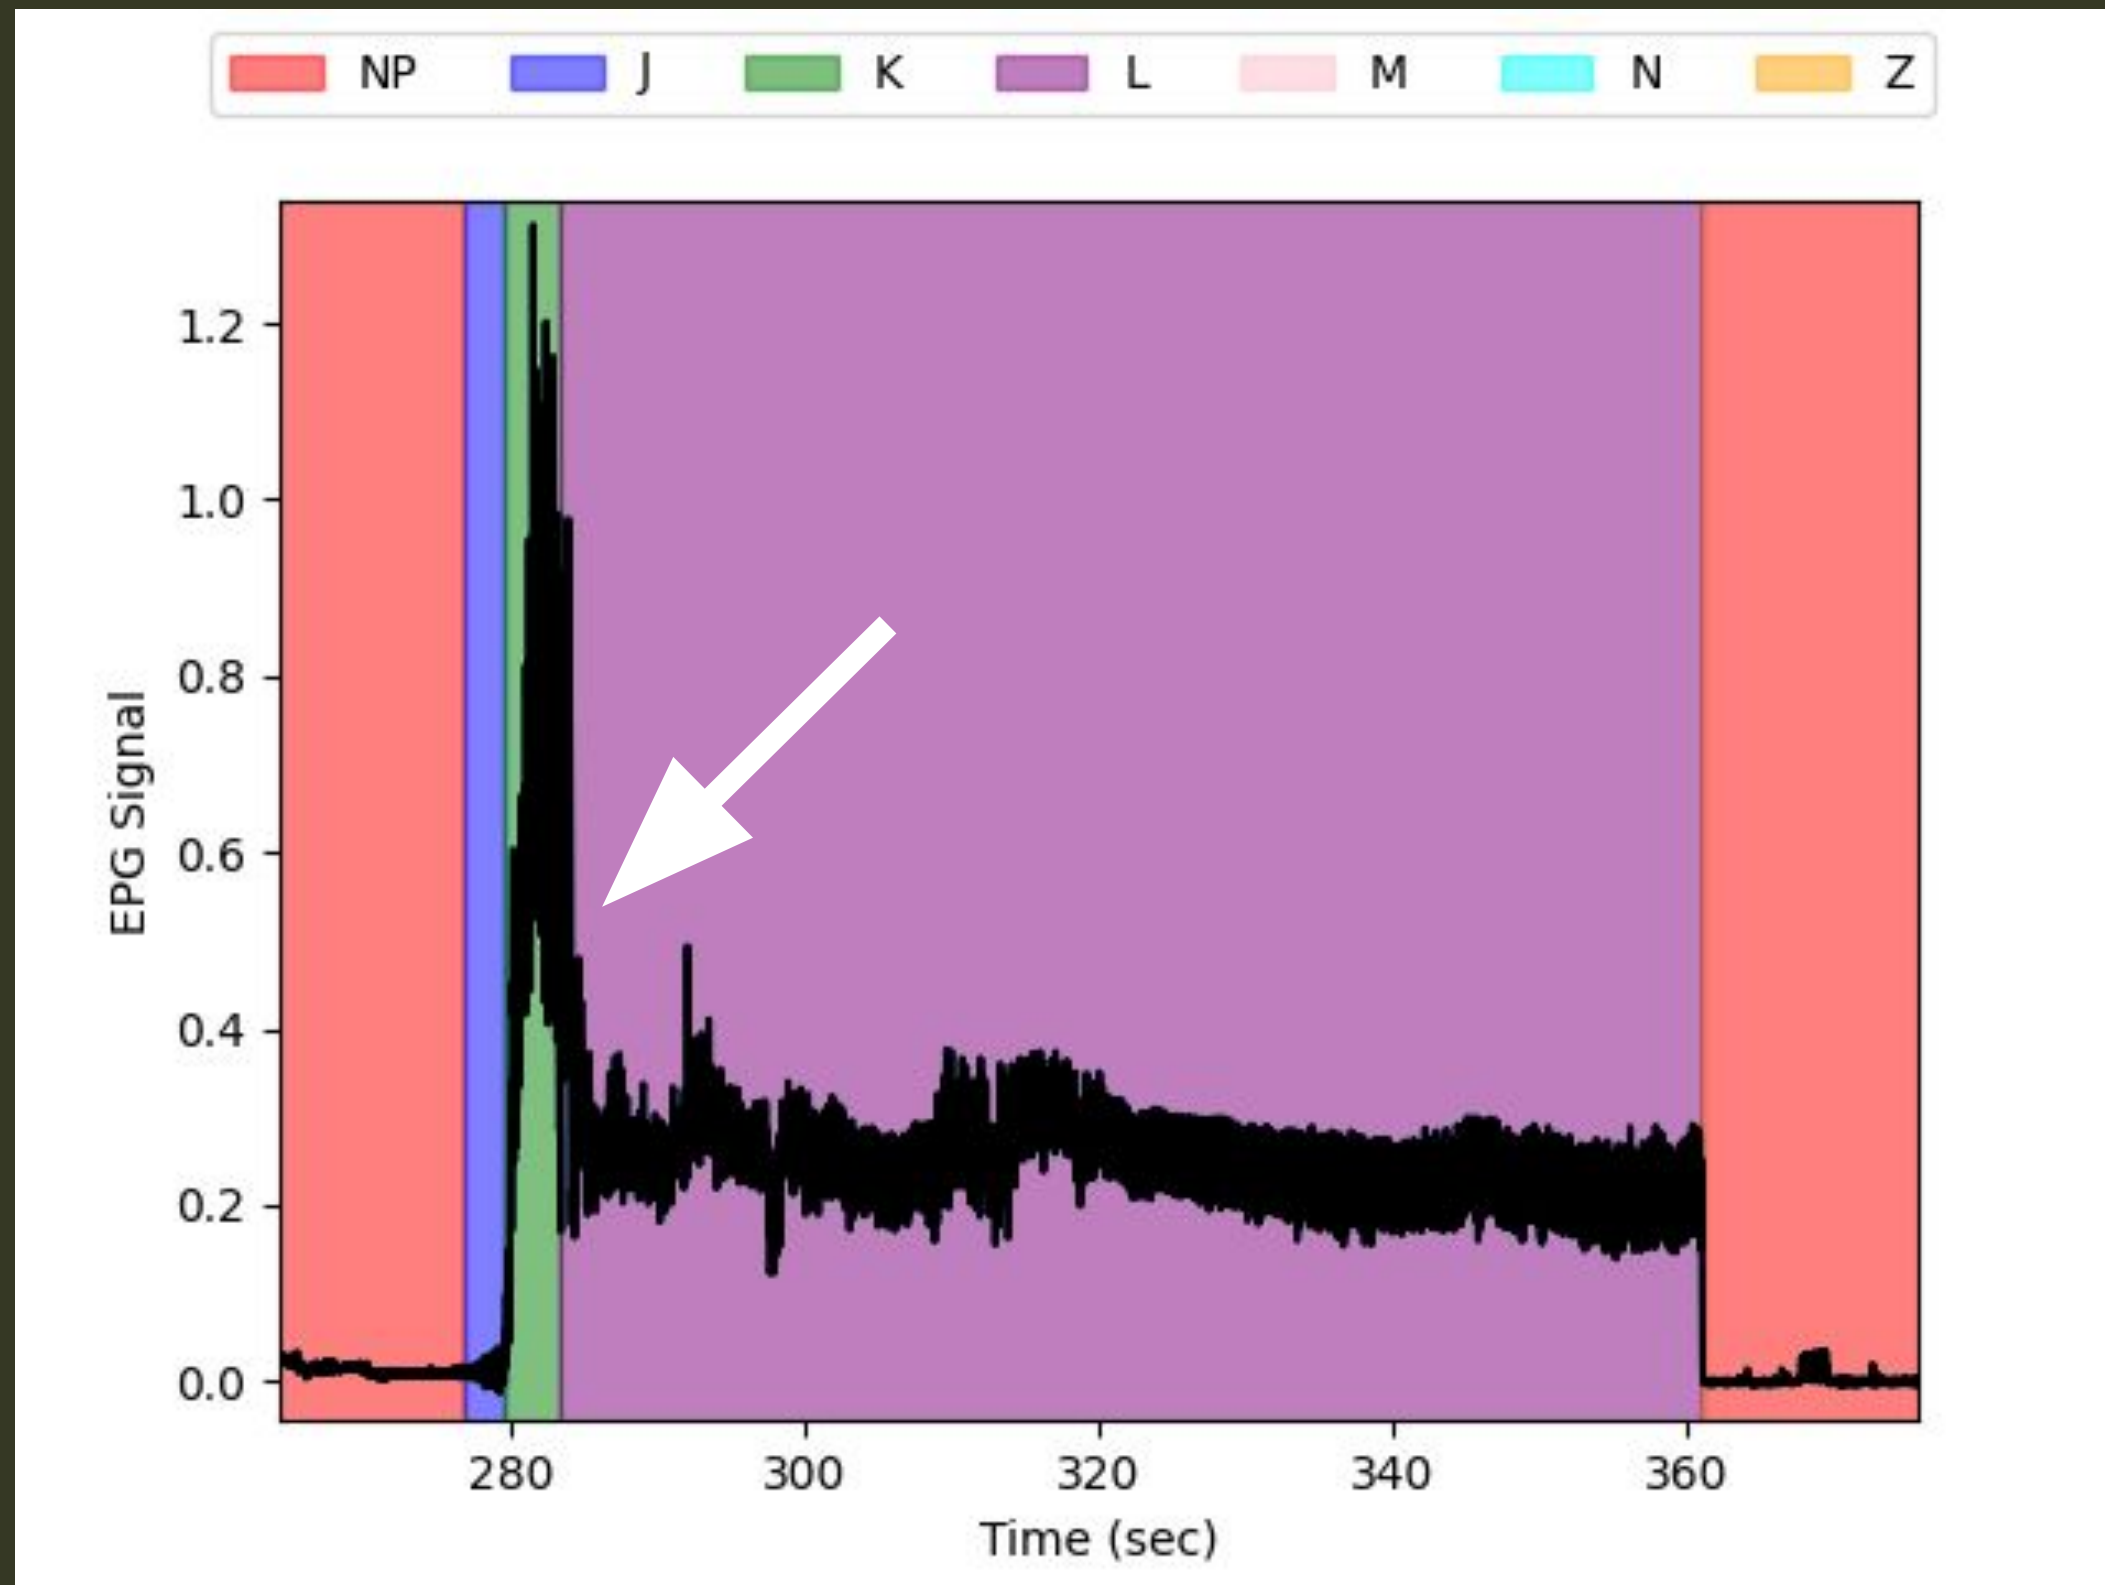

EPG Recording

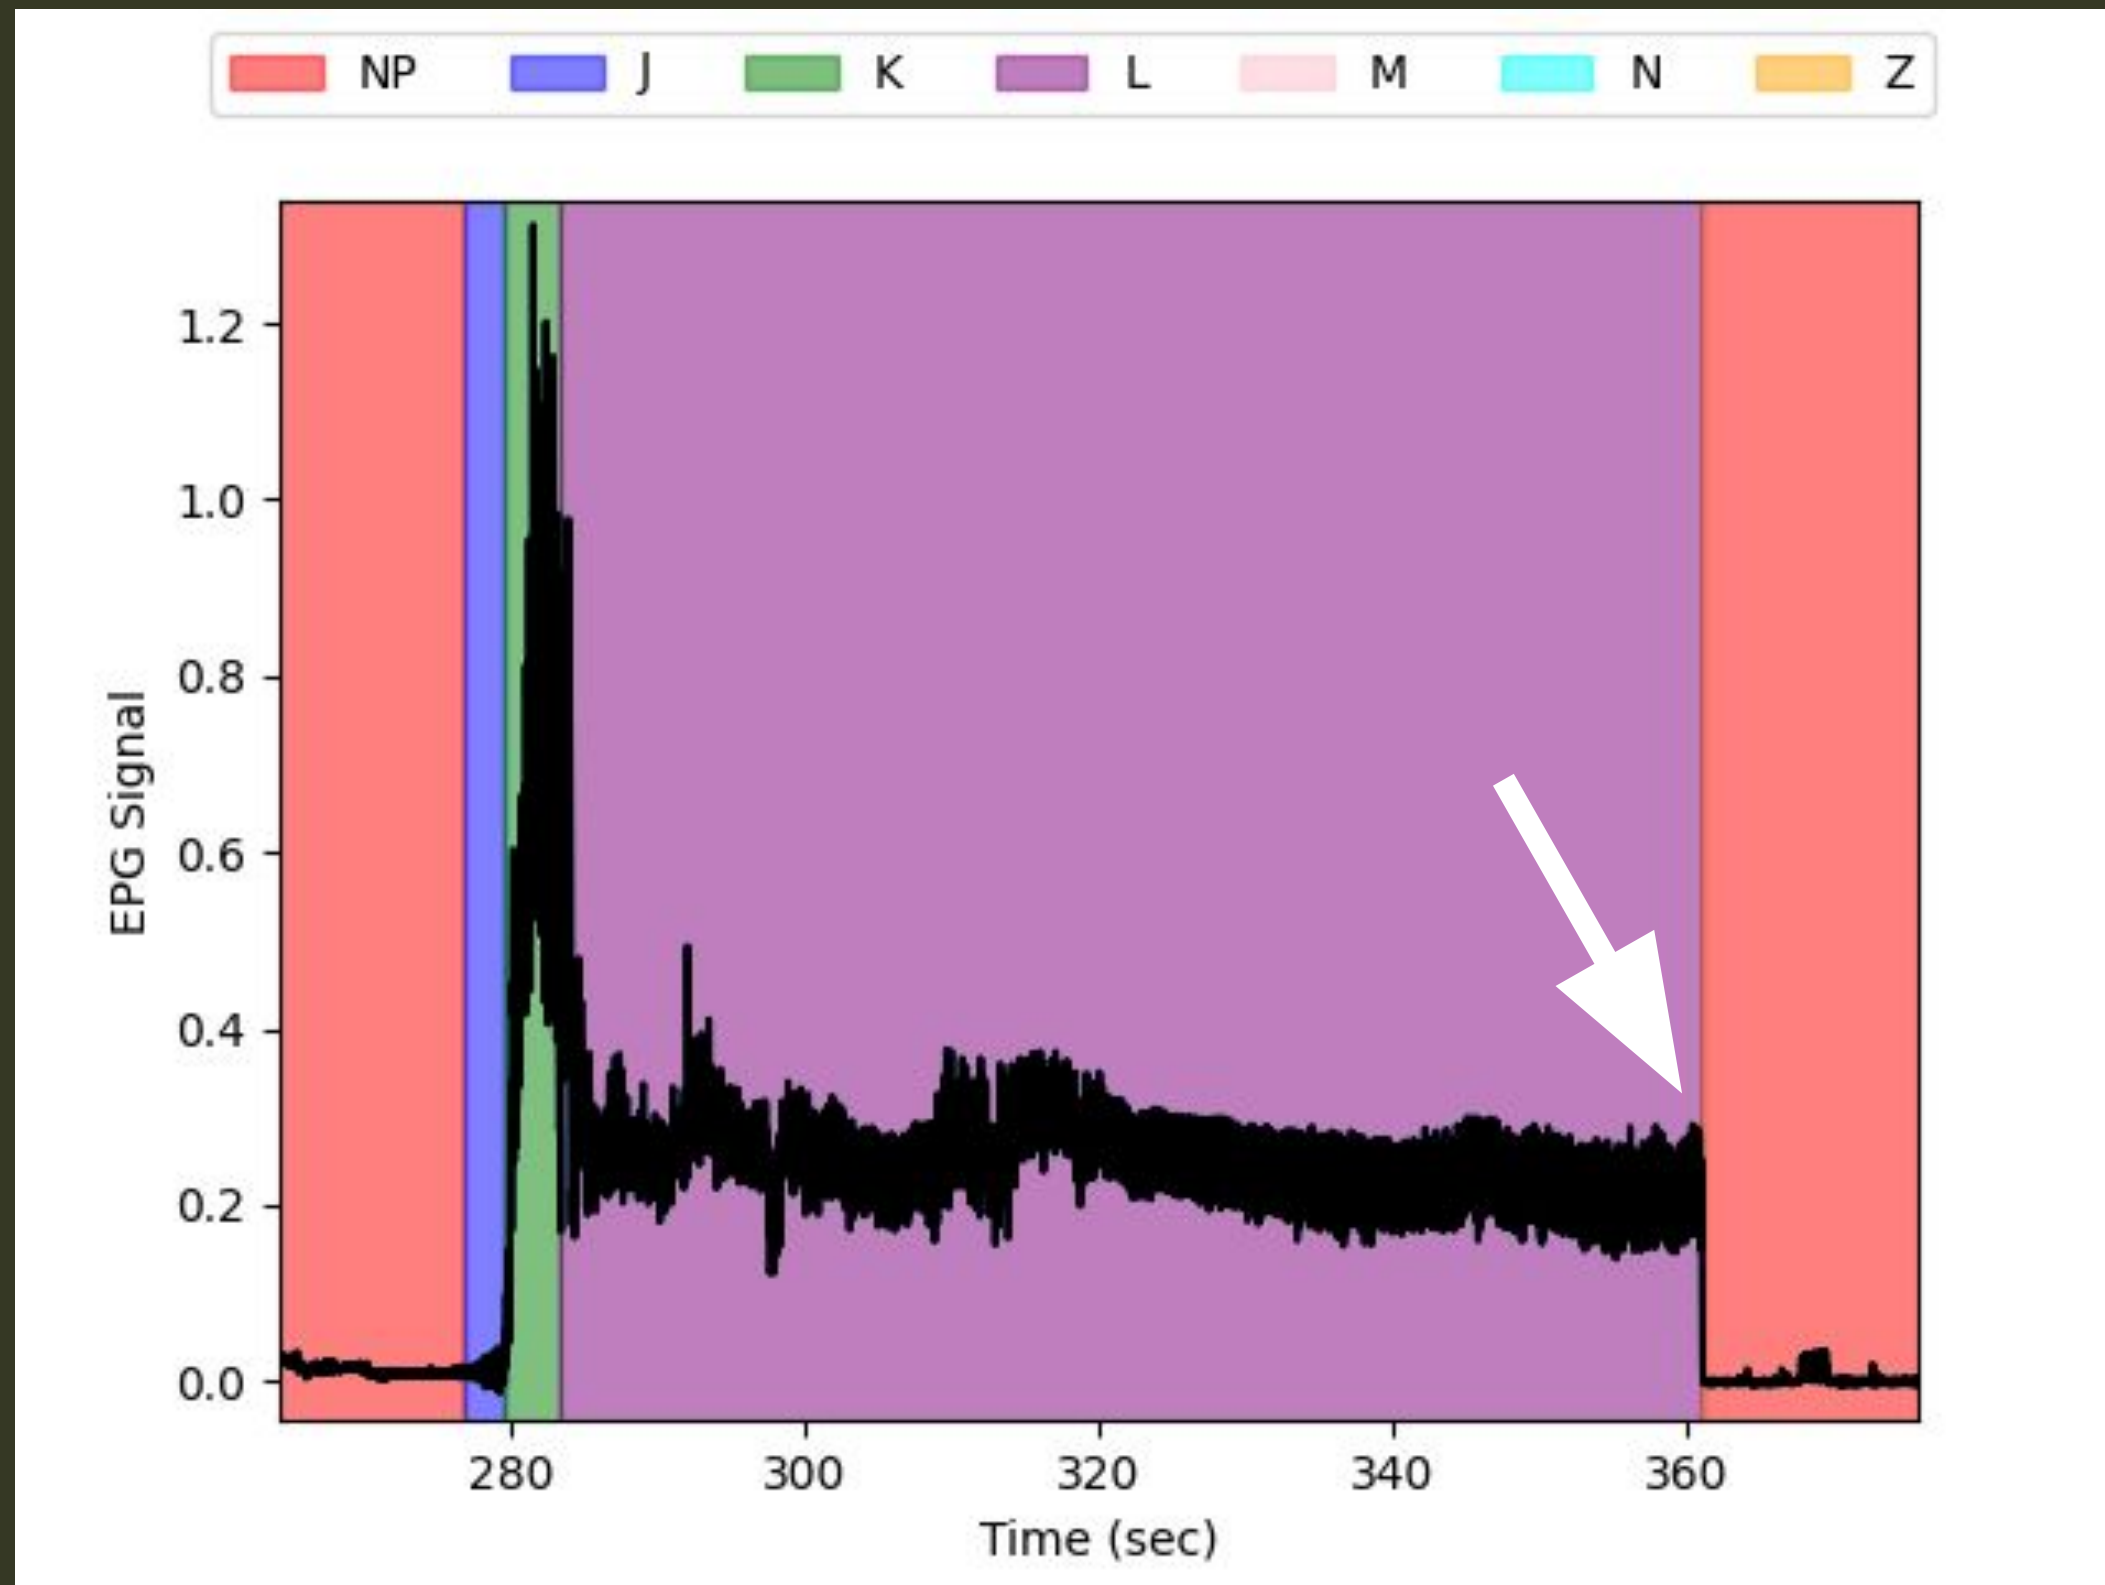

EPG Recording

EPG Recording

EPG Recording

---

Our task: Automate EPG labelling and  
make it accessible

---

# Deliverables

## **Train predictive ML models for waveform segmentation**

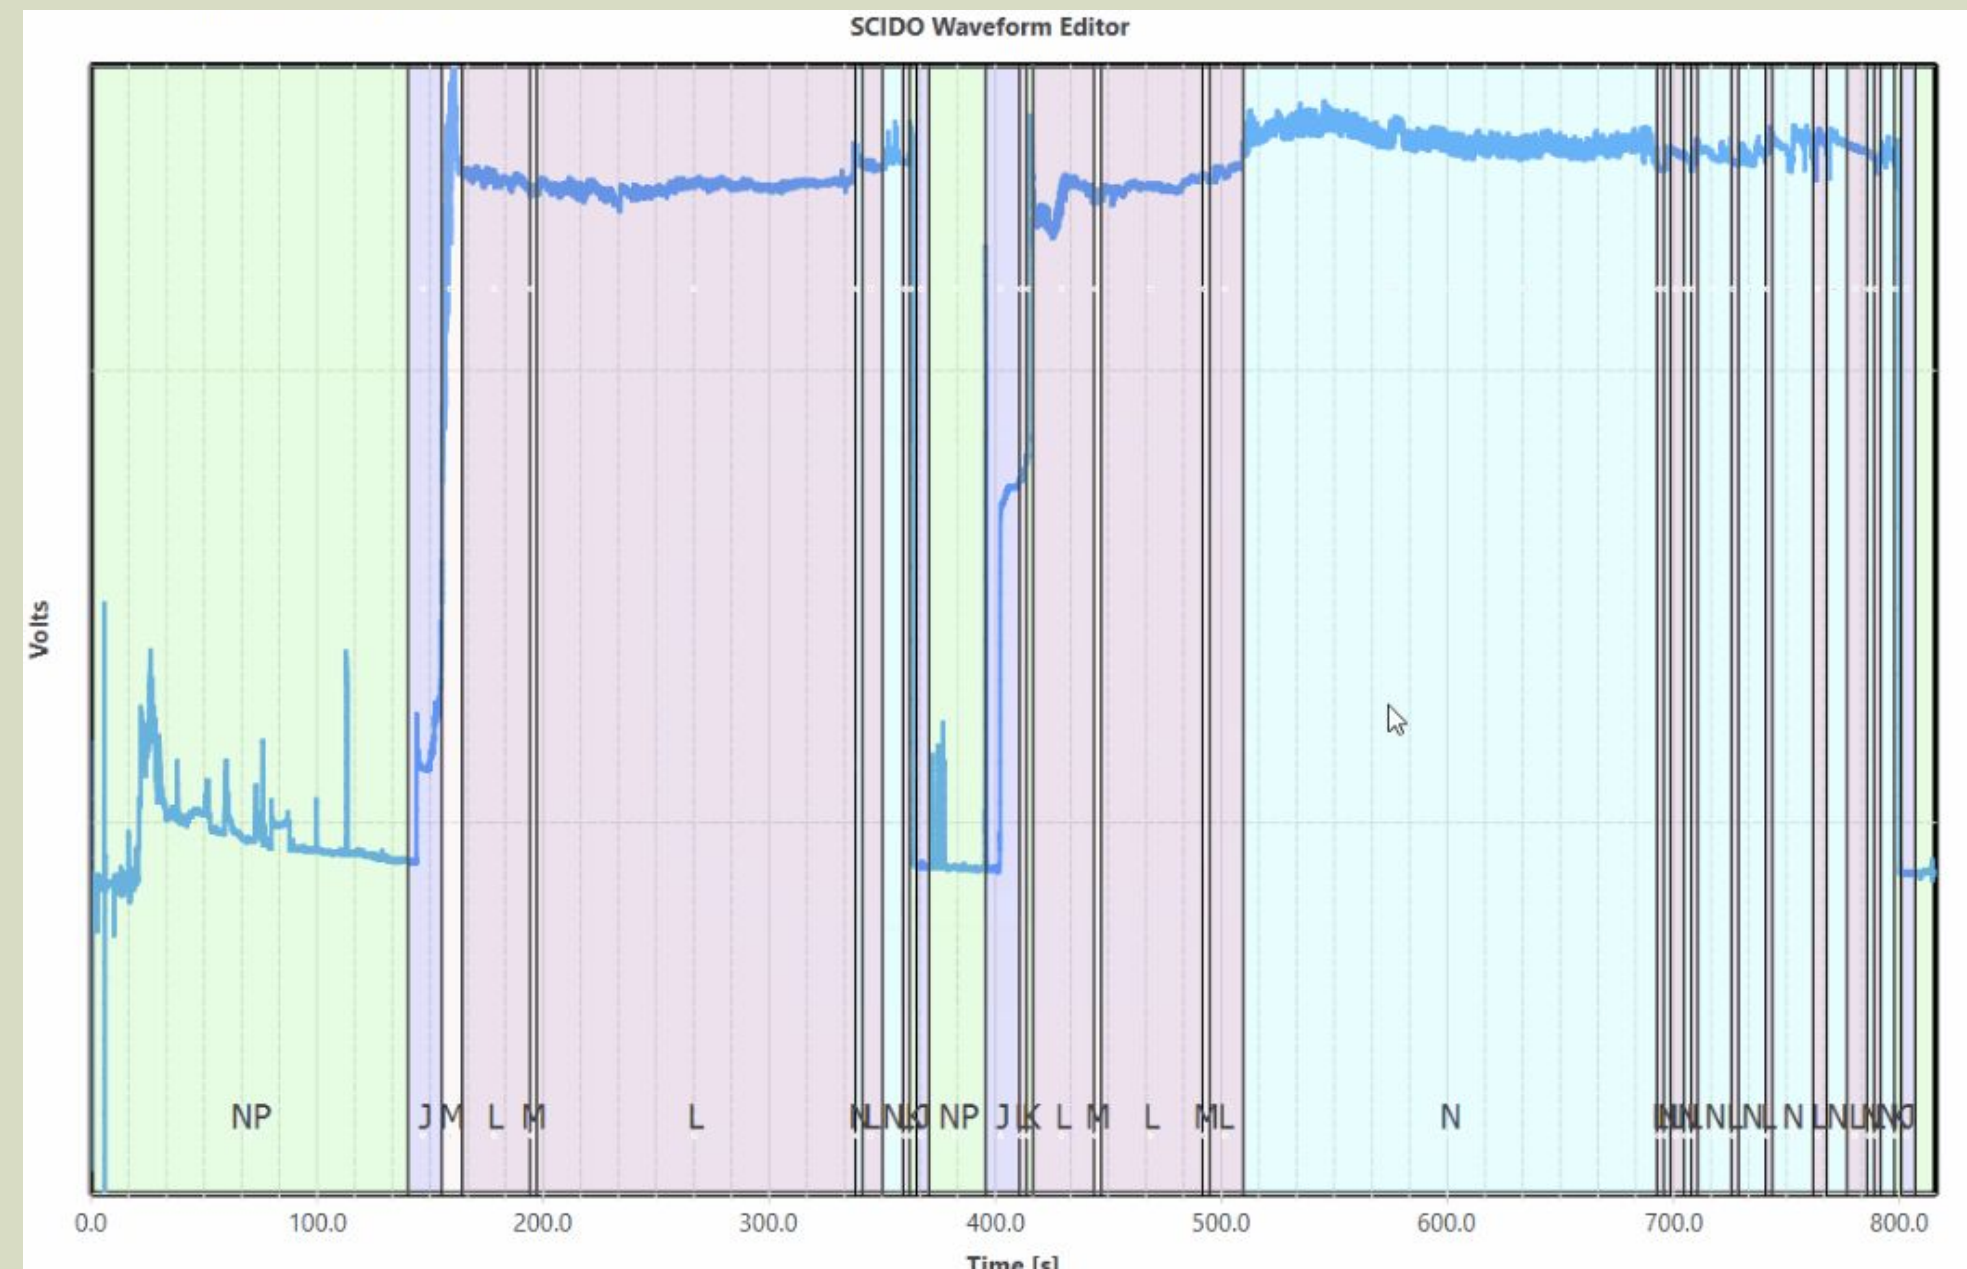

- . Explore approaches to automated EPG labeling
- . Accurately label EPG recordings
- . Integrate seamlessly with GUI

## **Present it with an accessible user interface**

- . Simple visualization of data
- . User oversight of the automated labeling
- . Tools for manual labeling

# Why ML?

- Labeling is a tedious process for humans
- For automated recognition, we need:
  - Consistency
  - Speed
- Makes it perfect for a ML model!

# Why do they need a GUI?

- Windaq is inefficient and cumbersome
- Doesn't work with ML
- Not extendable
- Can't plug models in

# Workflow

## Visualization (data-to-user)

- Labeled EPG data in time series
- Color-coded regions highlighted
- Overall modernized experience compared to Windaq

## Characterization (user-to-data)

- Apply the ML model to data
- Adjust, delete, modify labels
- Characterization without alterations to dataset

# The Software

**S**upervised  
**C**lassification of  
**I**nsect  
**D**ata and  
**O**bservations

SCIDO

# Opening Files

# Probe Splitting

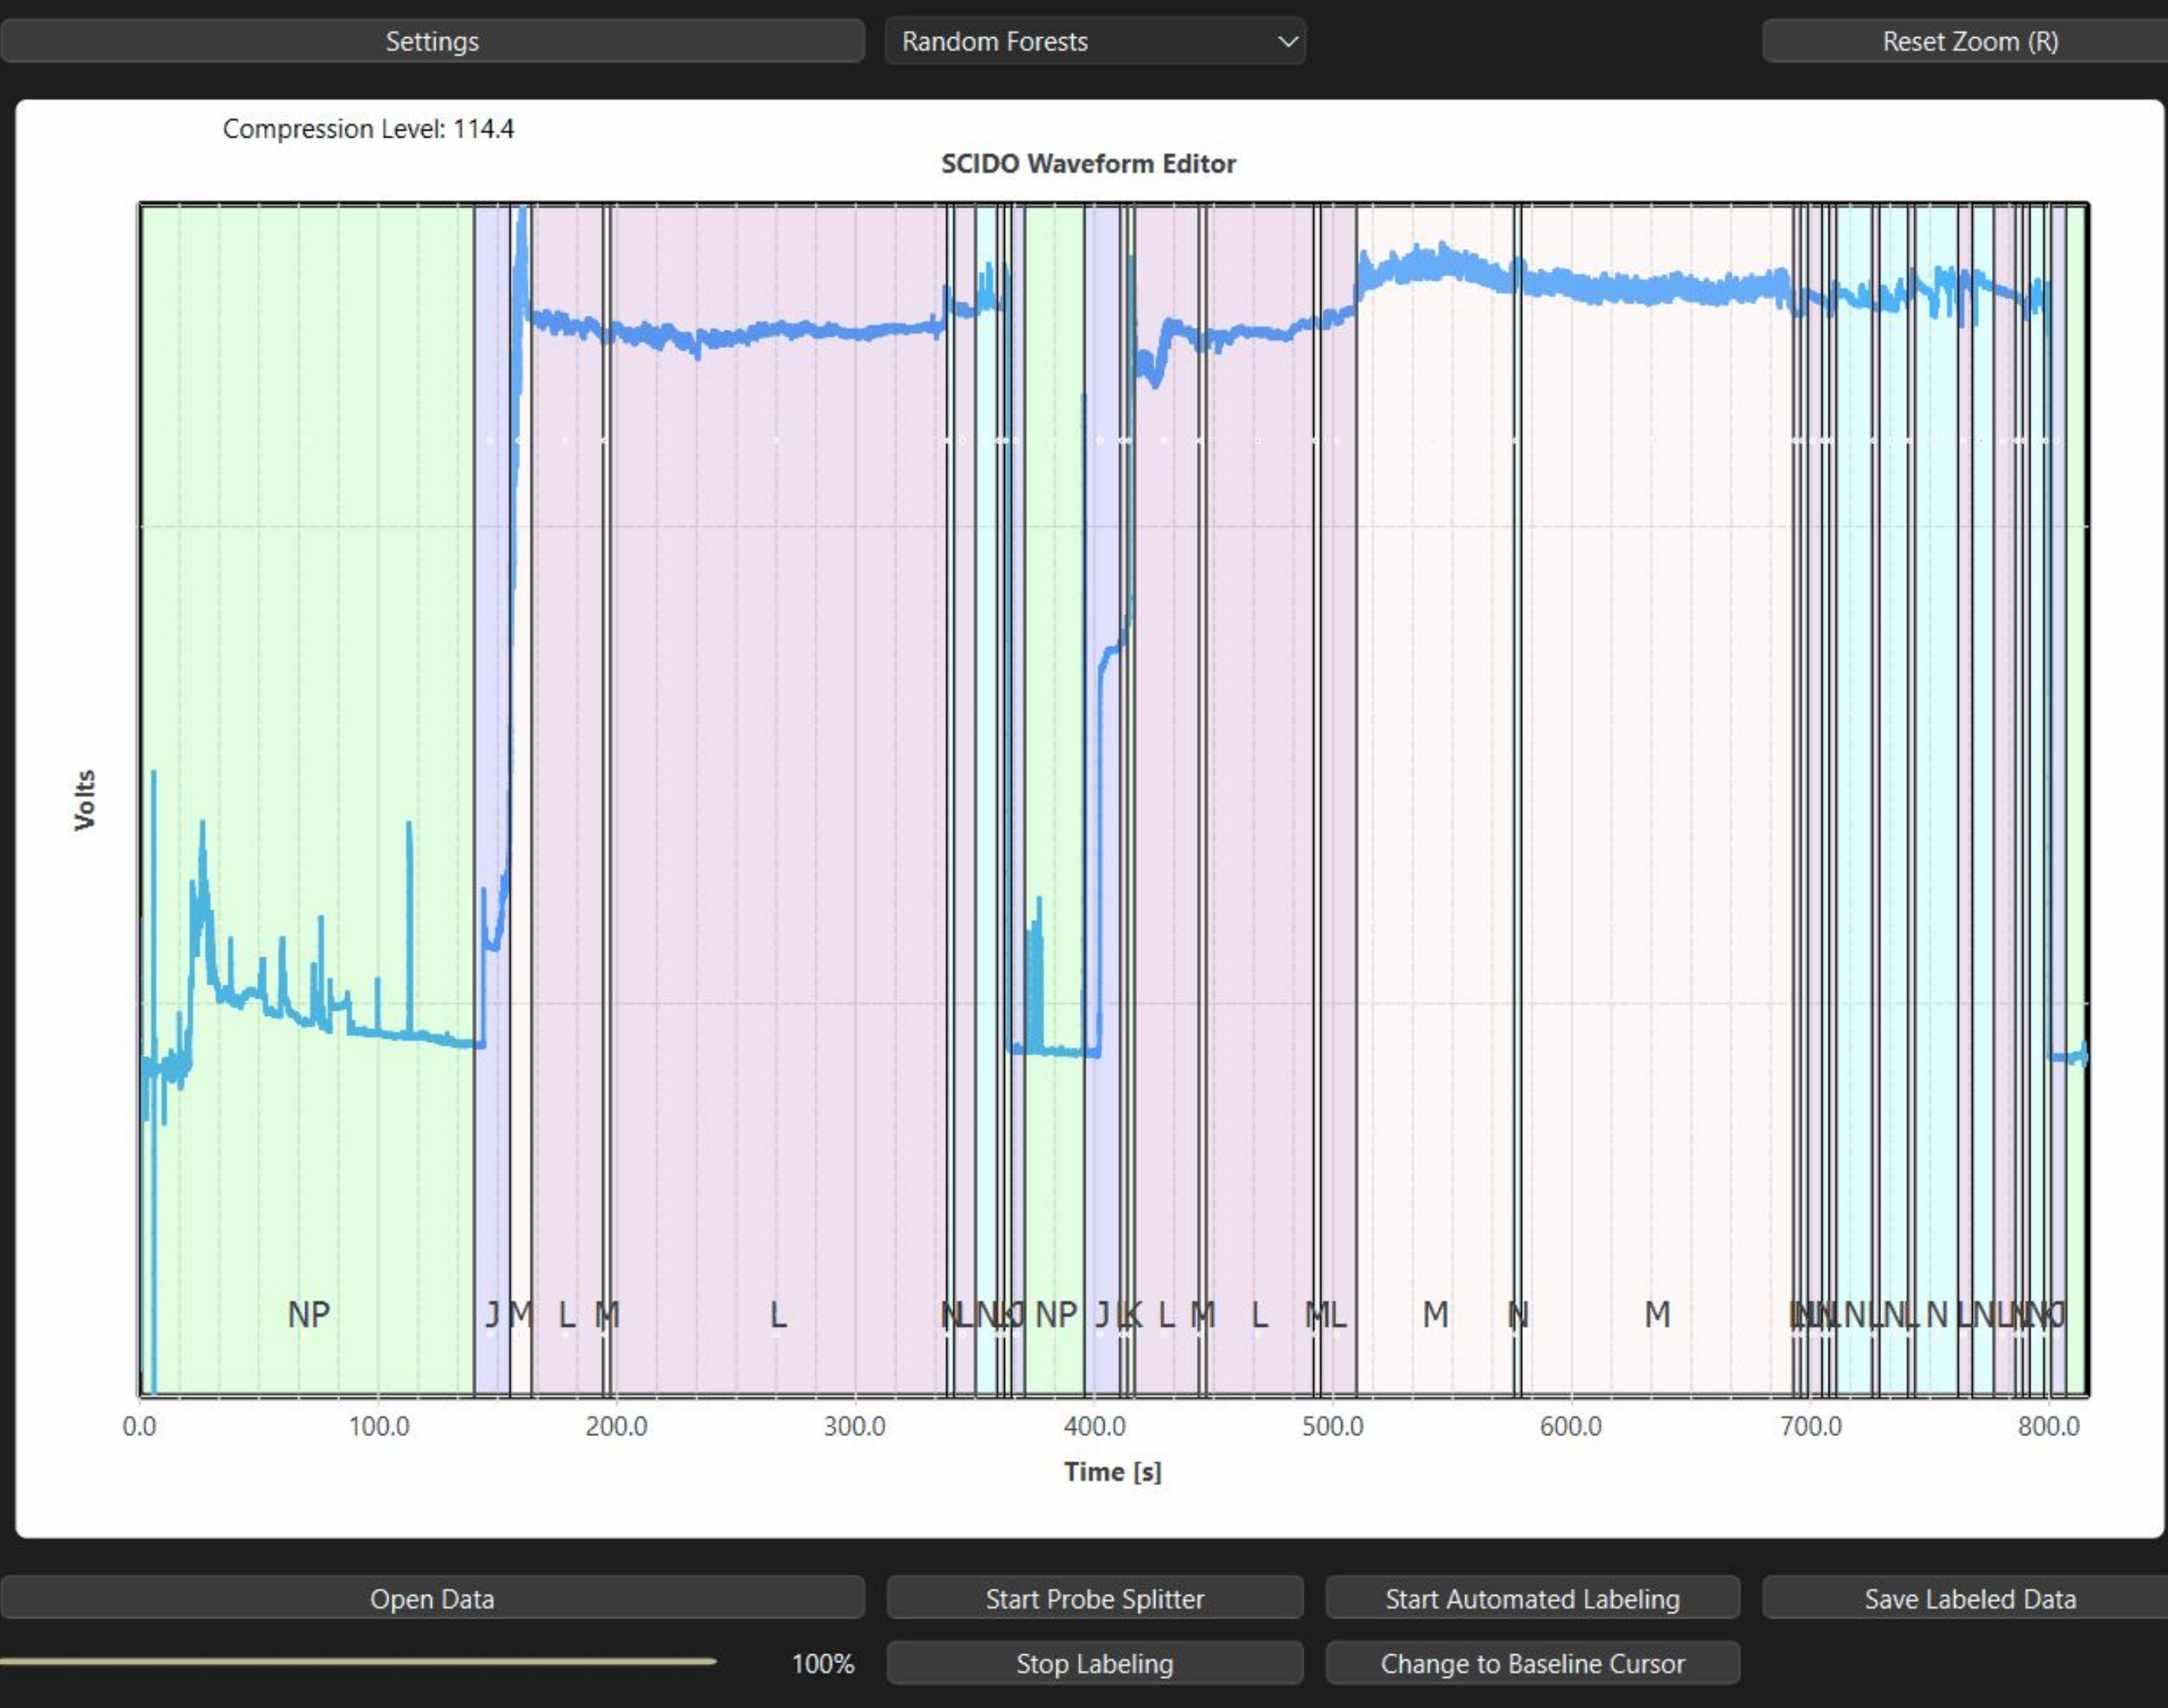

# ML Labeling

# Viewing & Editing

# Chart Visuals

# Saving Files

# The Data

- Annotated EPG recordings
- 62 files
- 94 probes
- about 11 hours of probing data

Highly imbalanced data

L: searching for a blood vessel

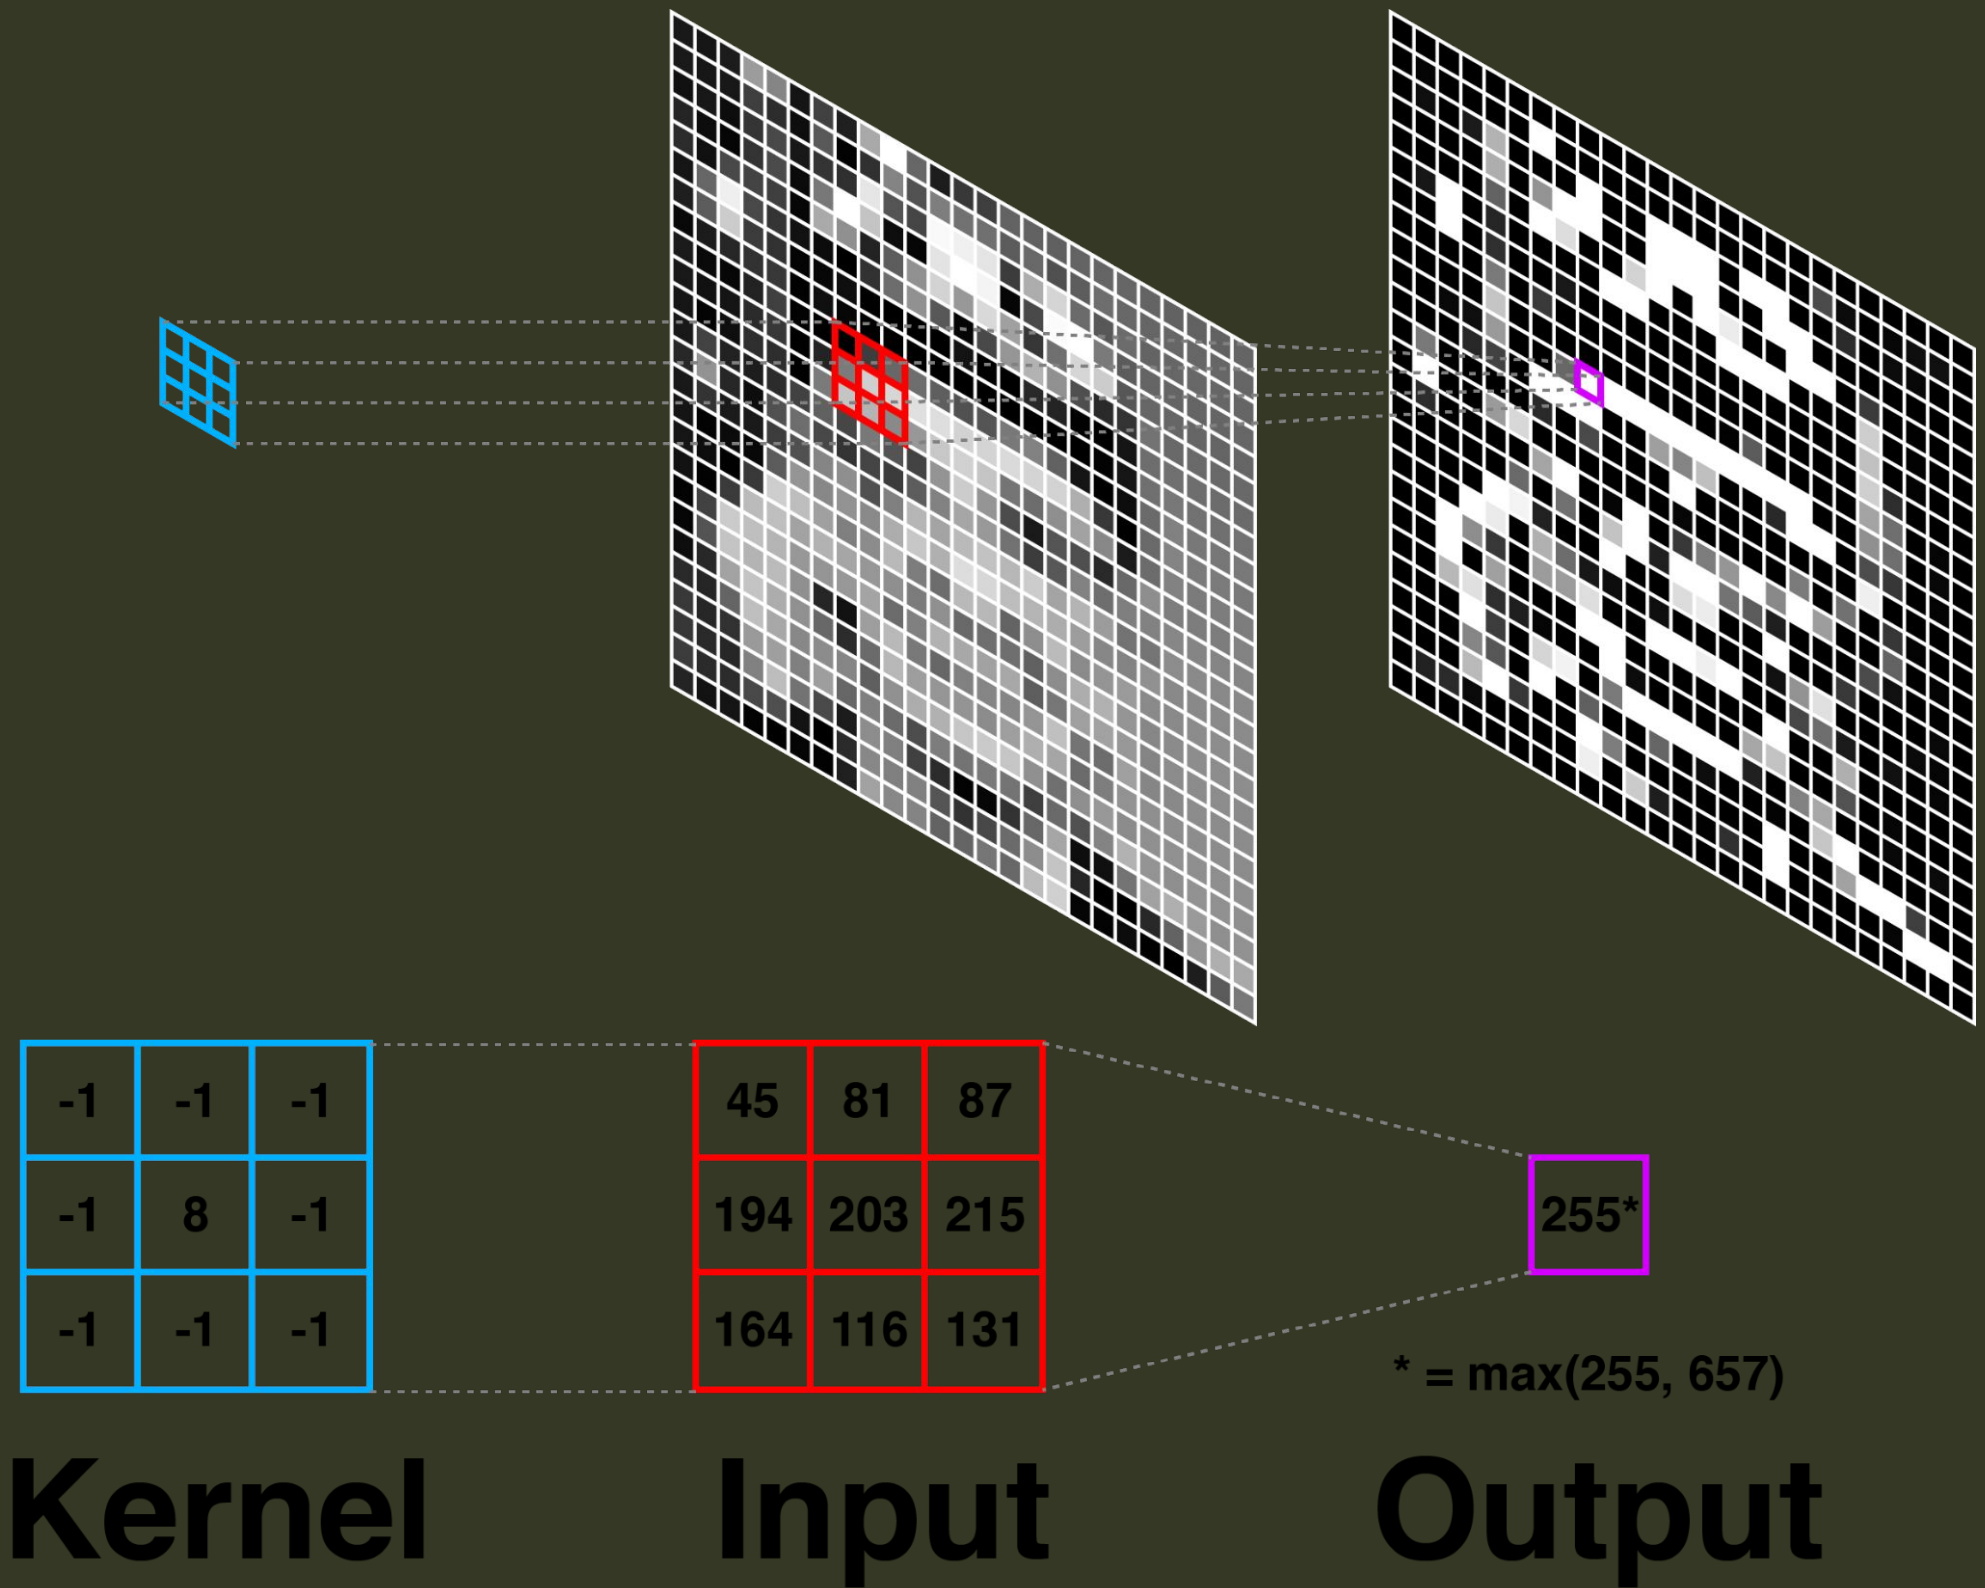

M: sucking blood

W: withdrawal

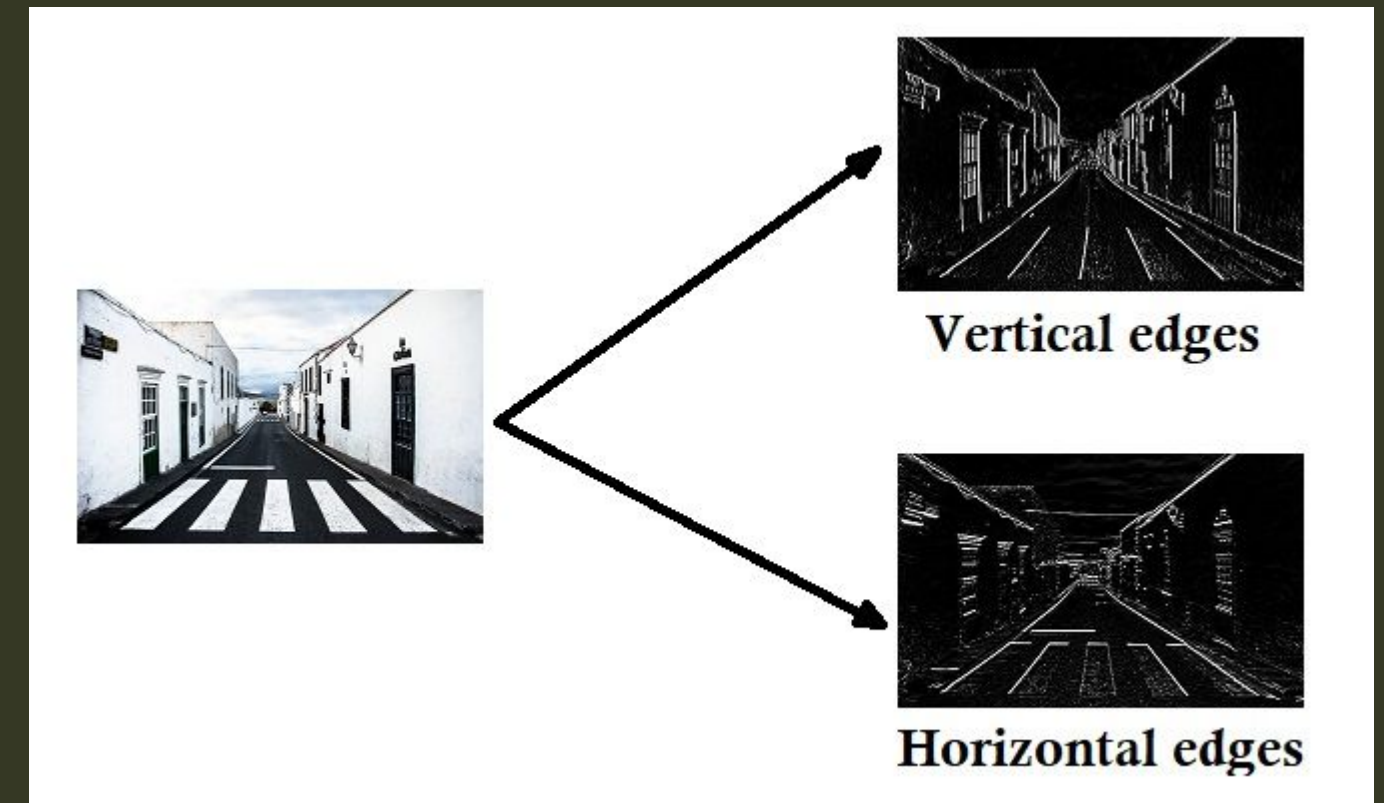

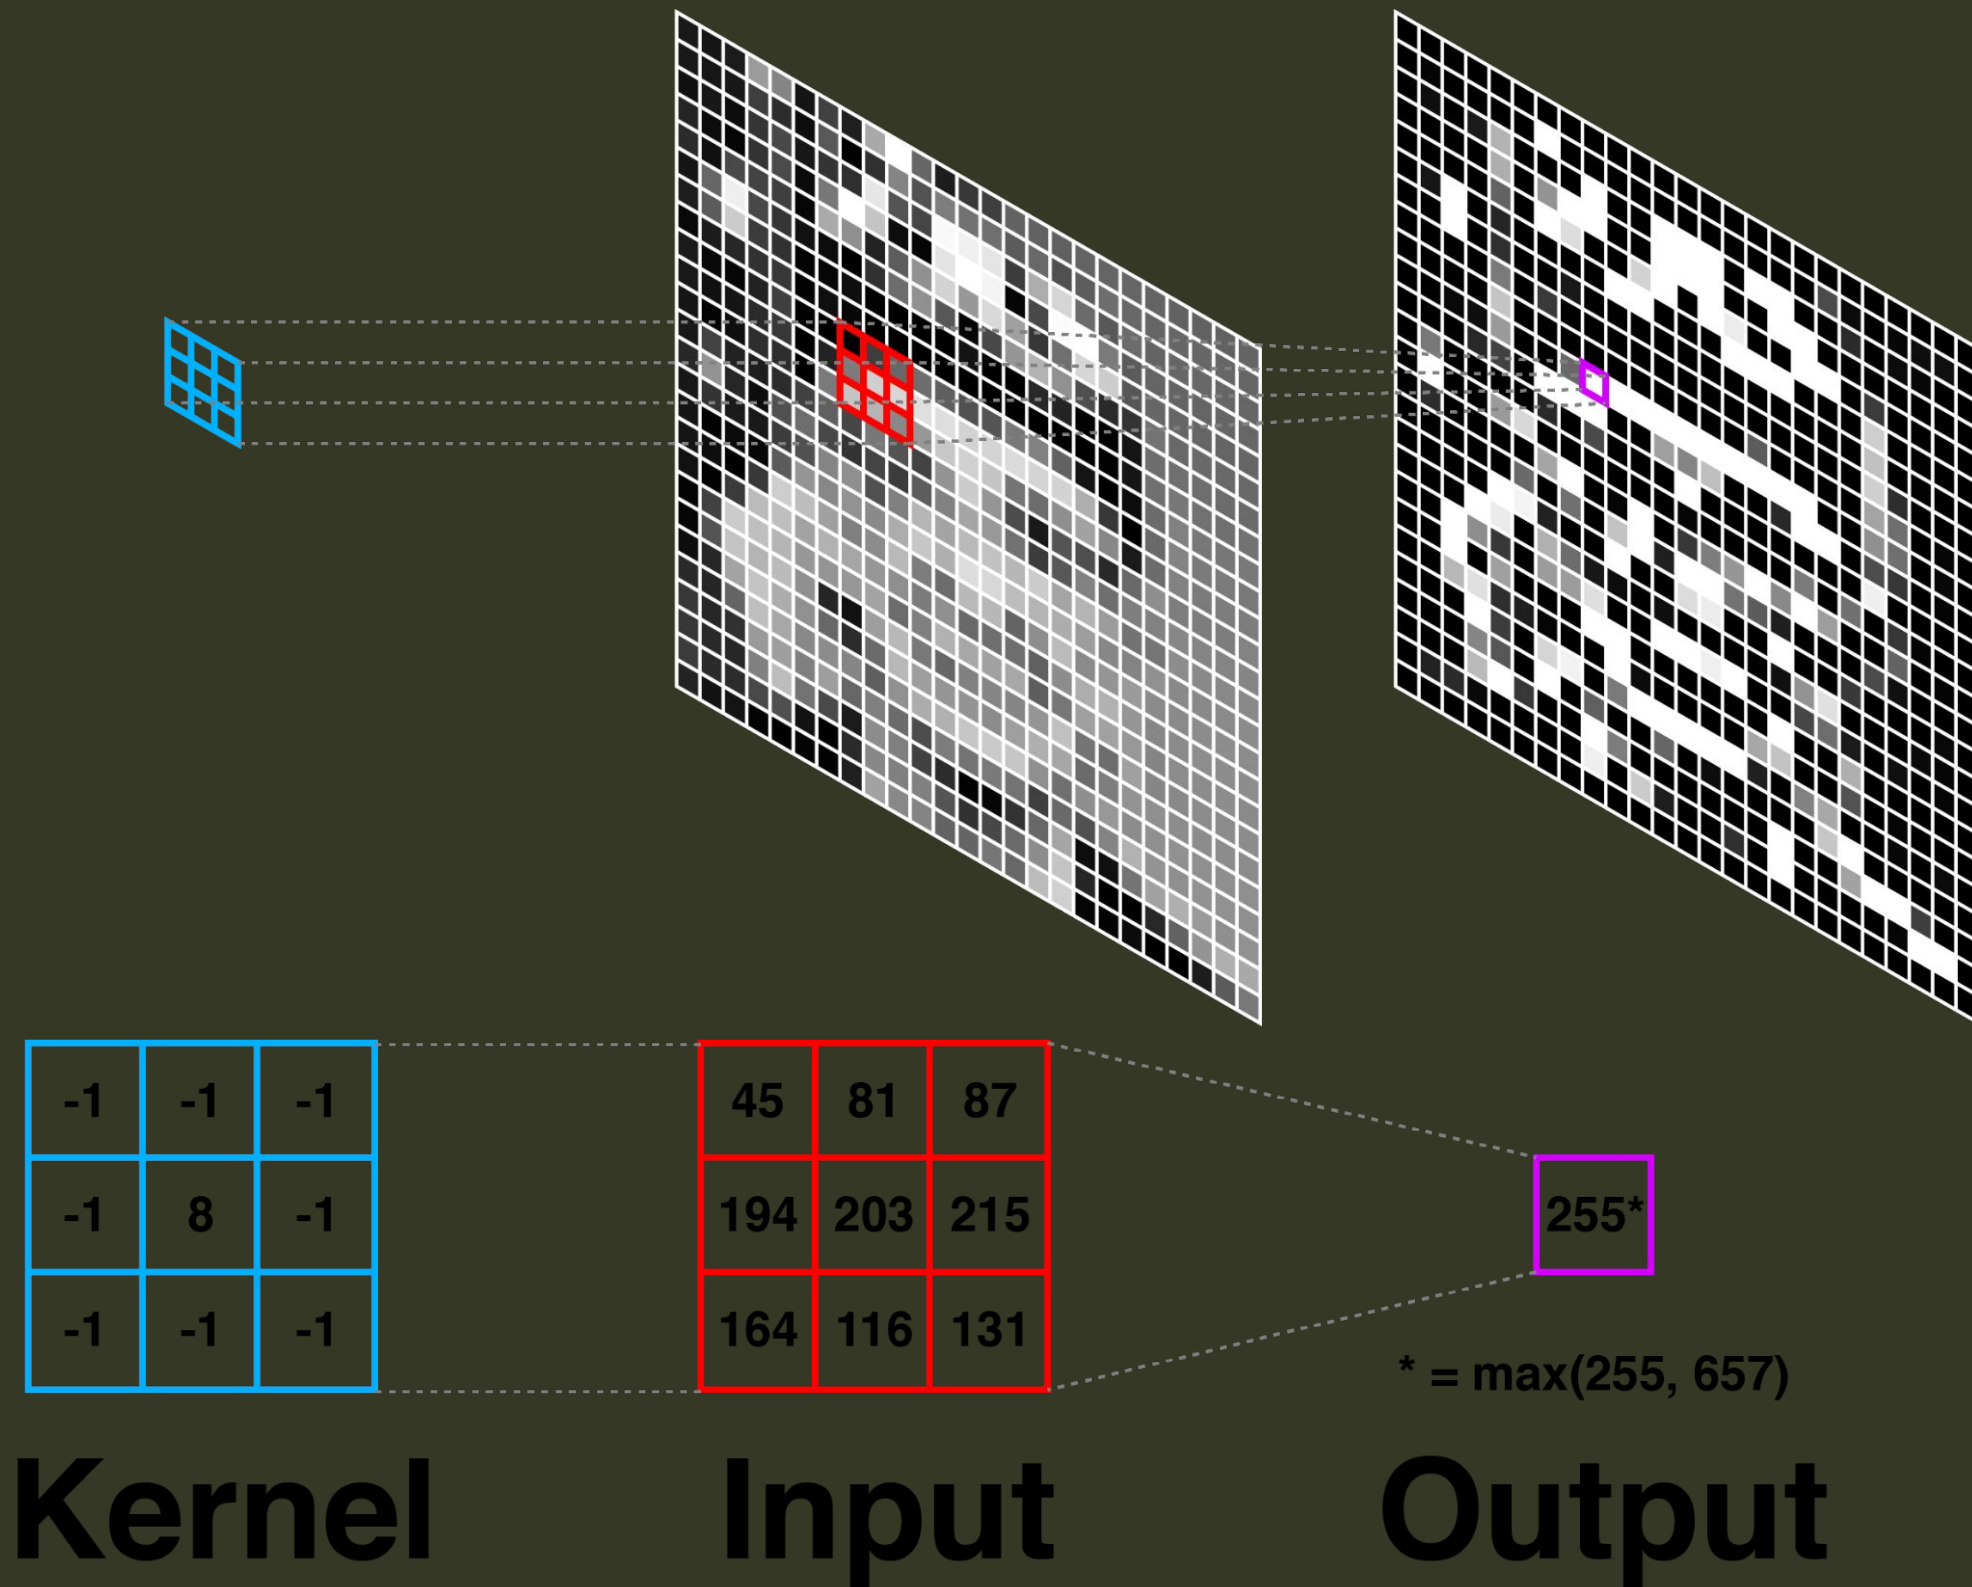

# Convolutions

# Convolutions

# What is a UNet

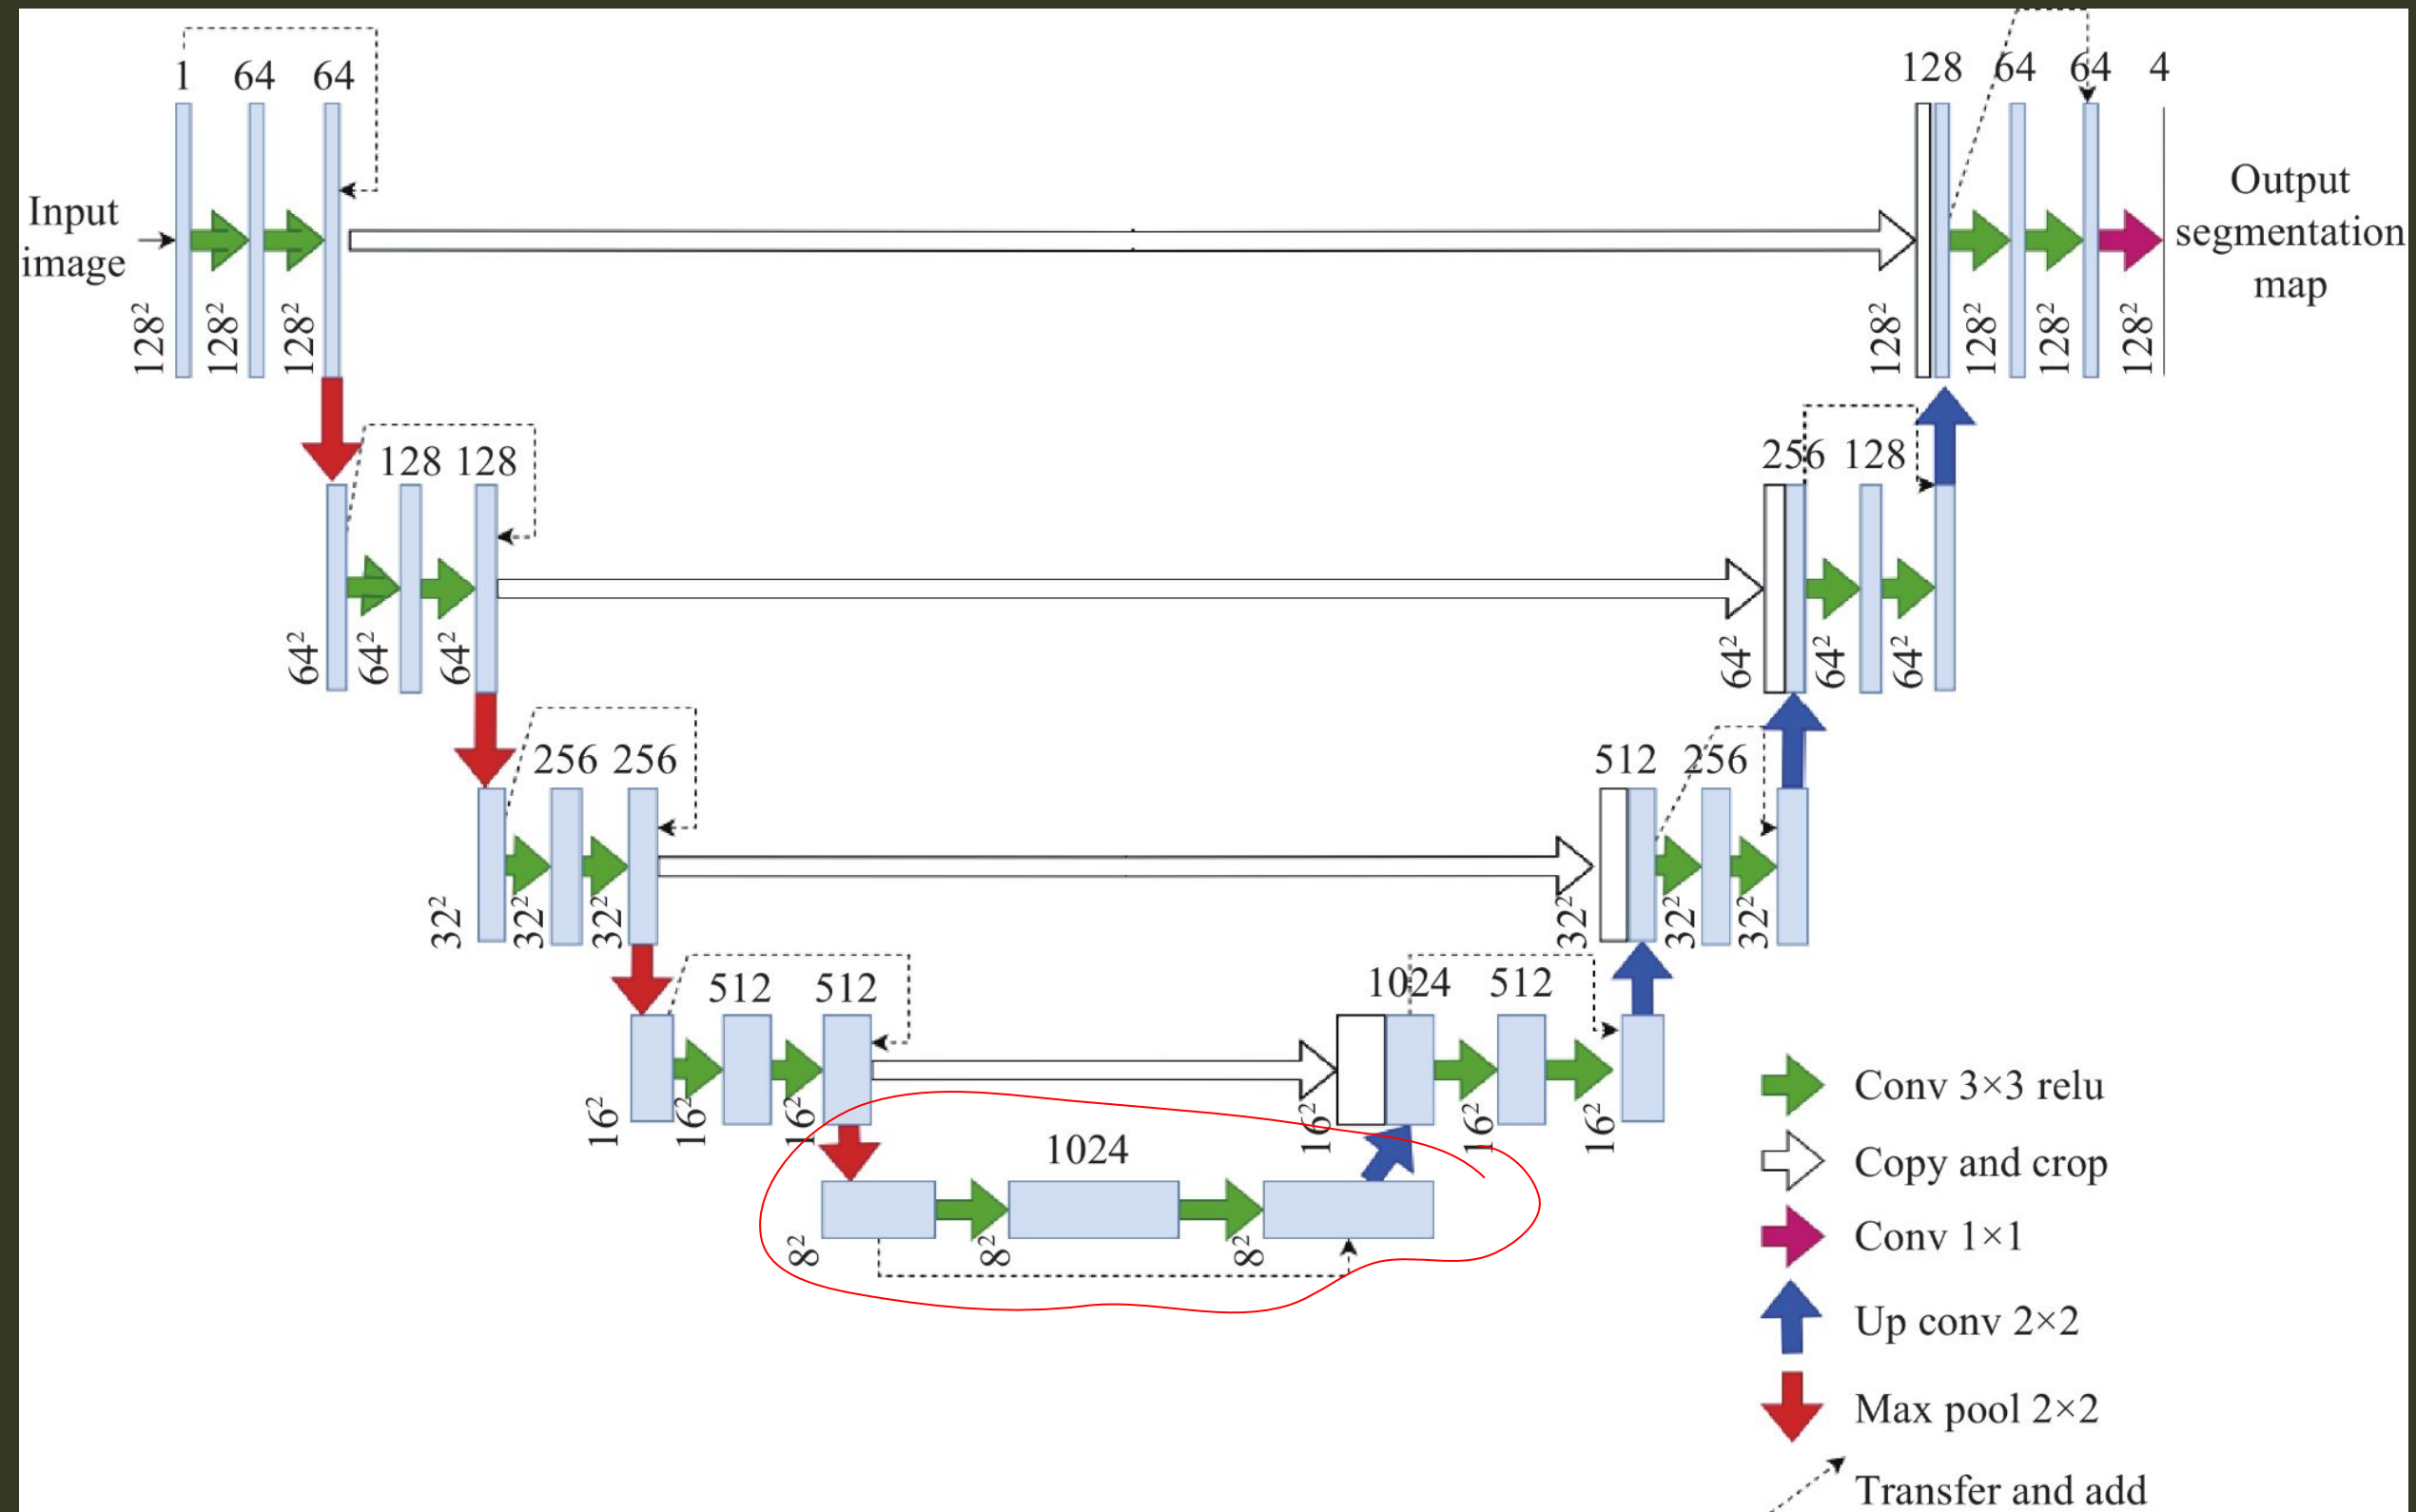

# A Problem: Receptive Field

# Adding Attention

---

# The Best Model: UNet (+ Attention)

## Pros:

- Can see a lot of the data at once (large receptive field)
- Powerful

## Cons:

- Can memorize the training data (overfitting)

---

# The Best Model: UNet (+ Attention)

Accuracy: ~82%

F1 score by waveform type:

	J	K	L	M	N	W
UNet	0.88	0.67	0.83	0.87	0.32	0.62

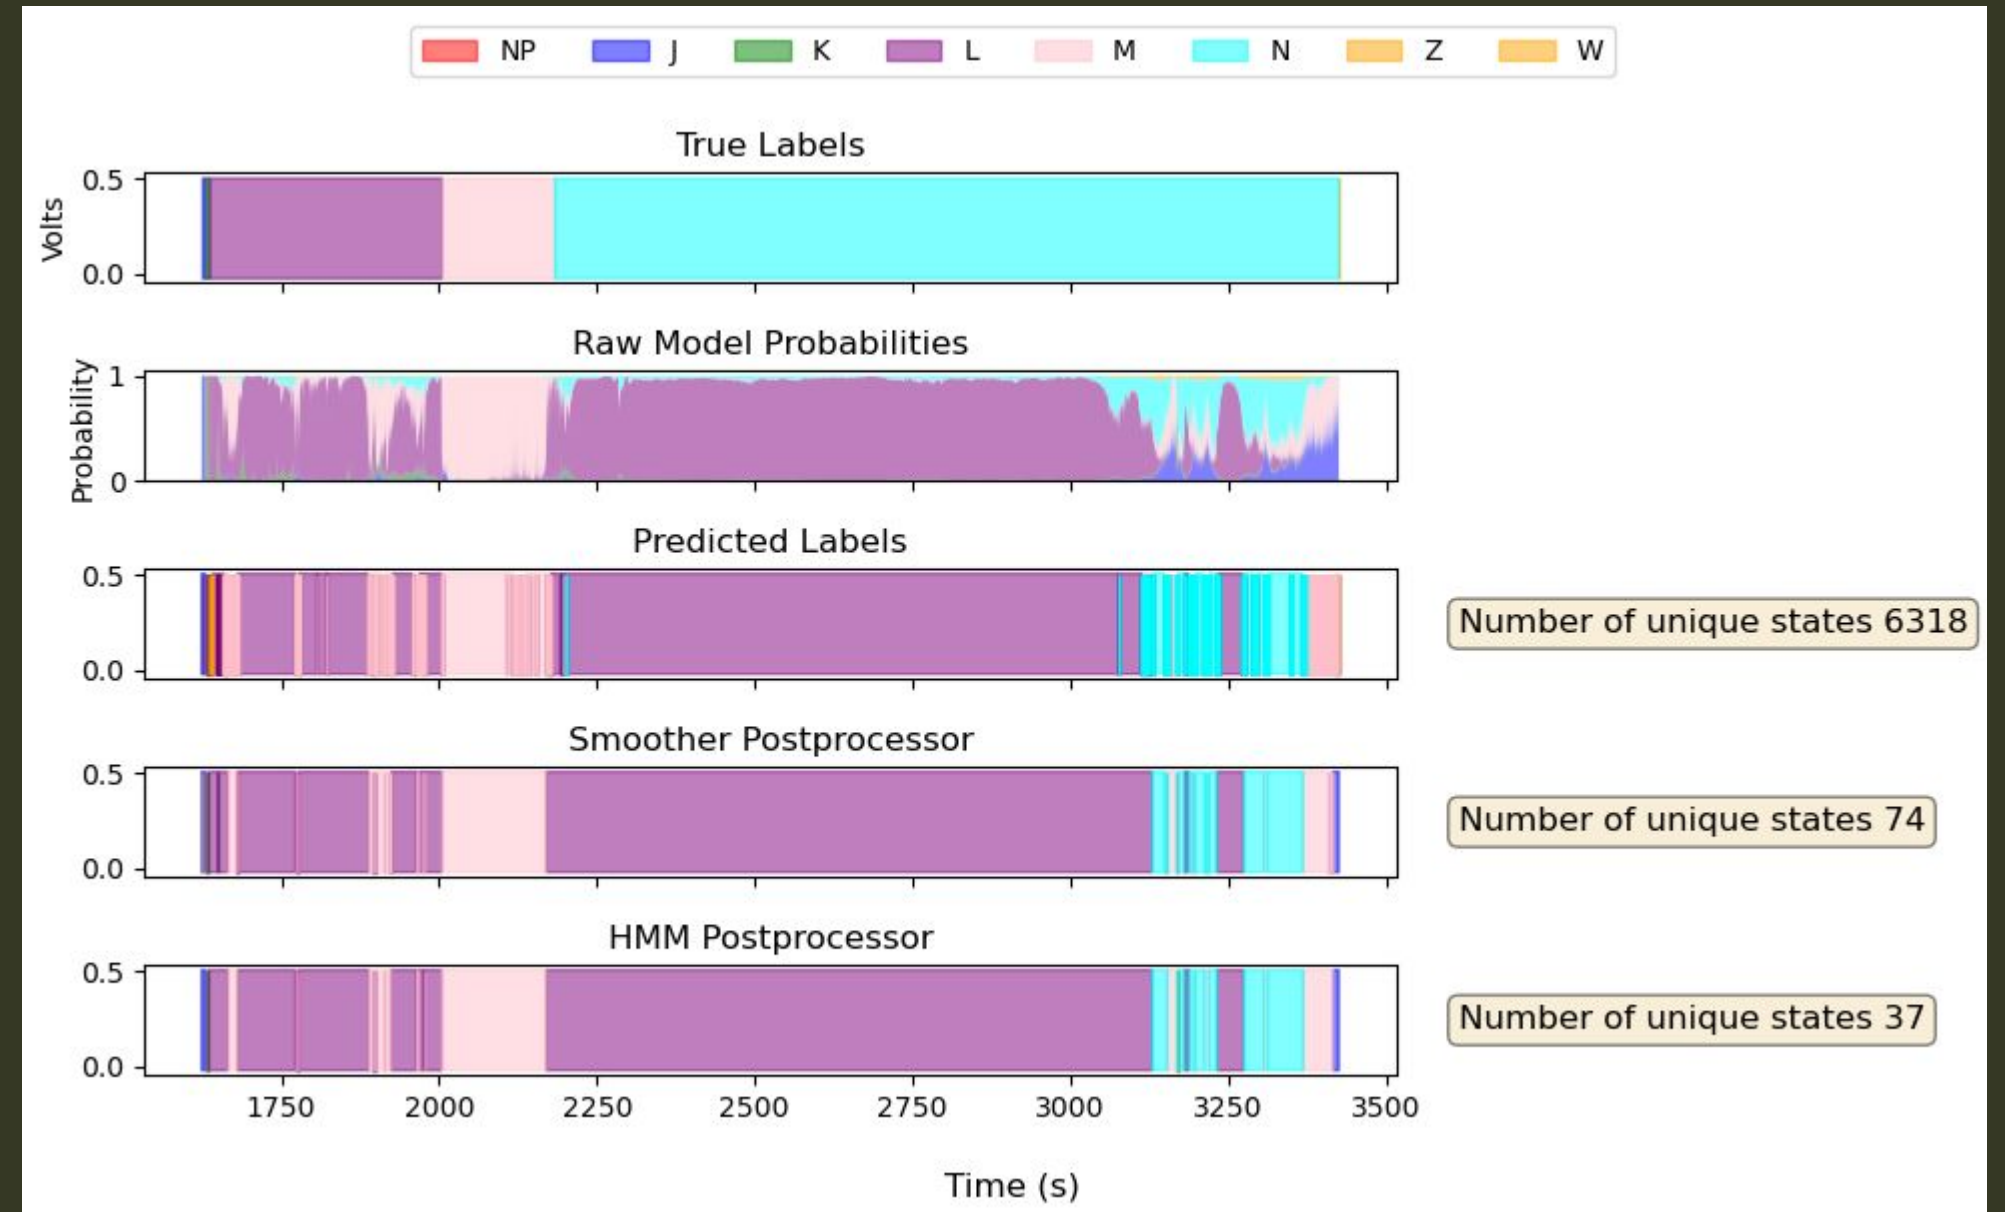

# The Best Model: UNet (+ Attention)

Observe barcodes

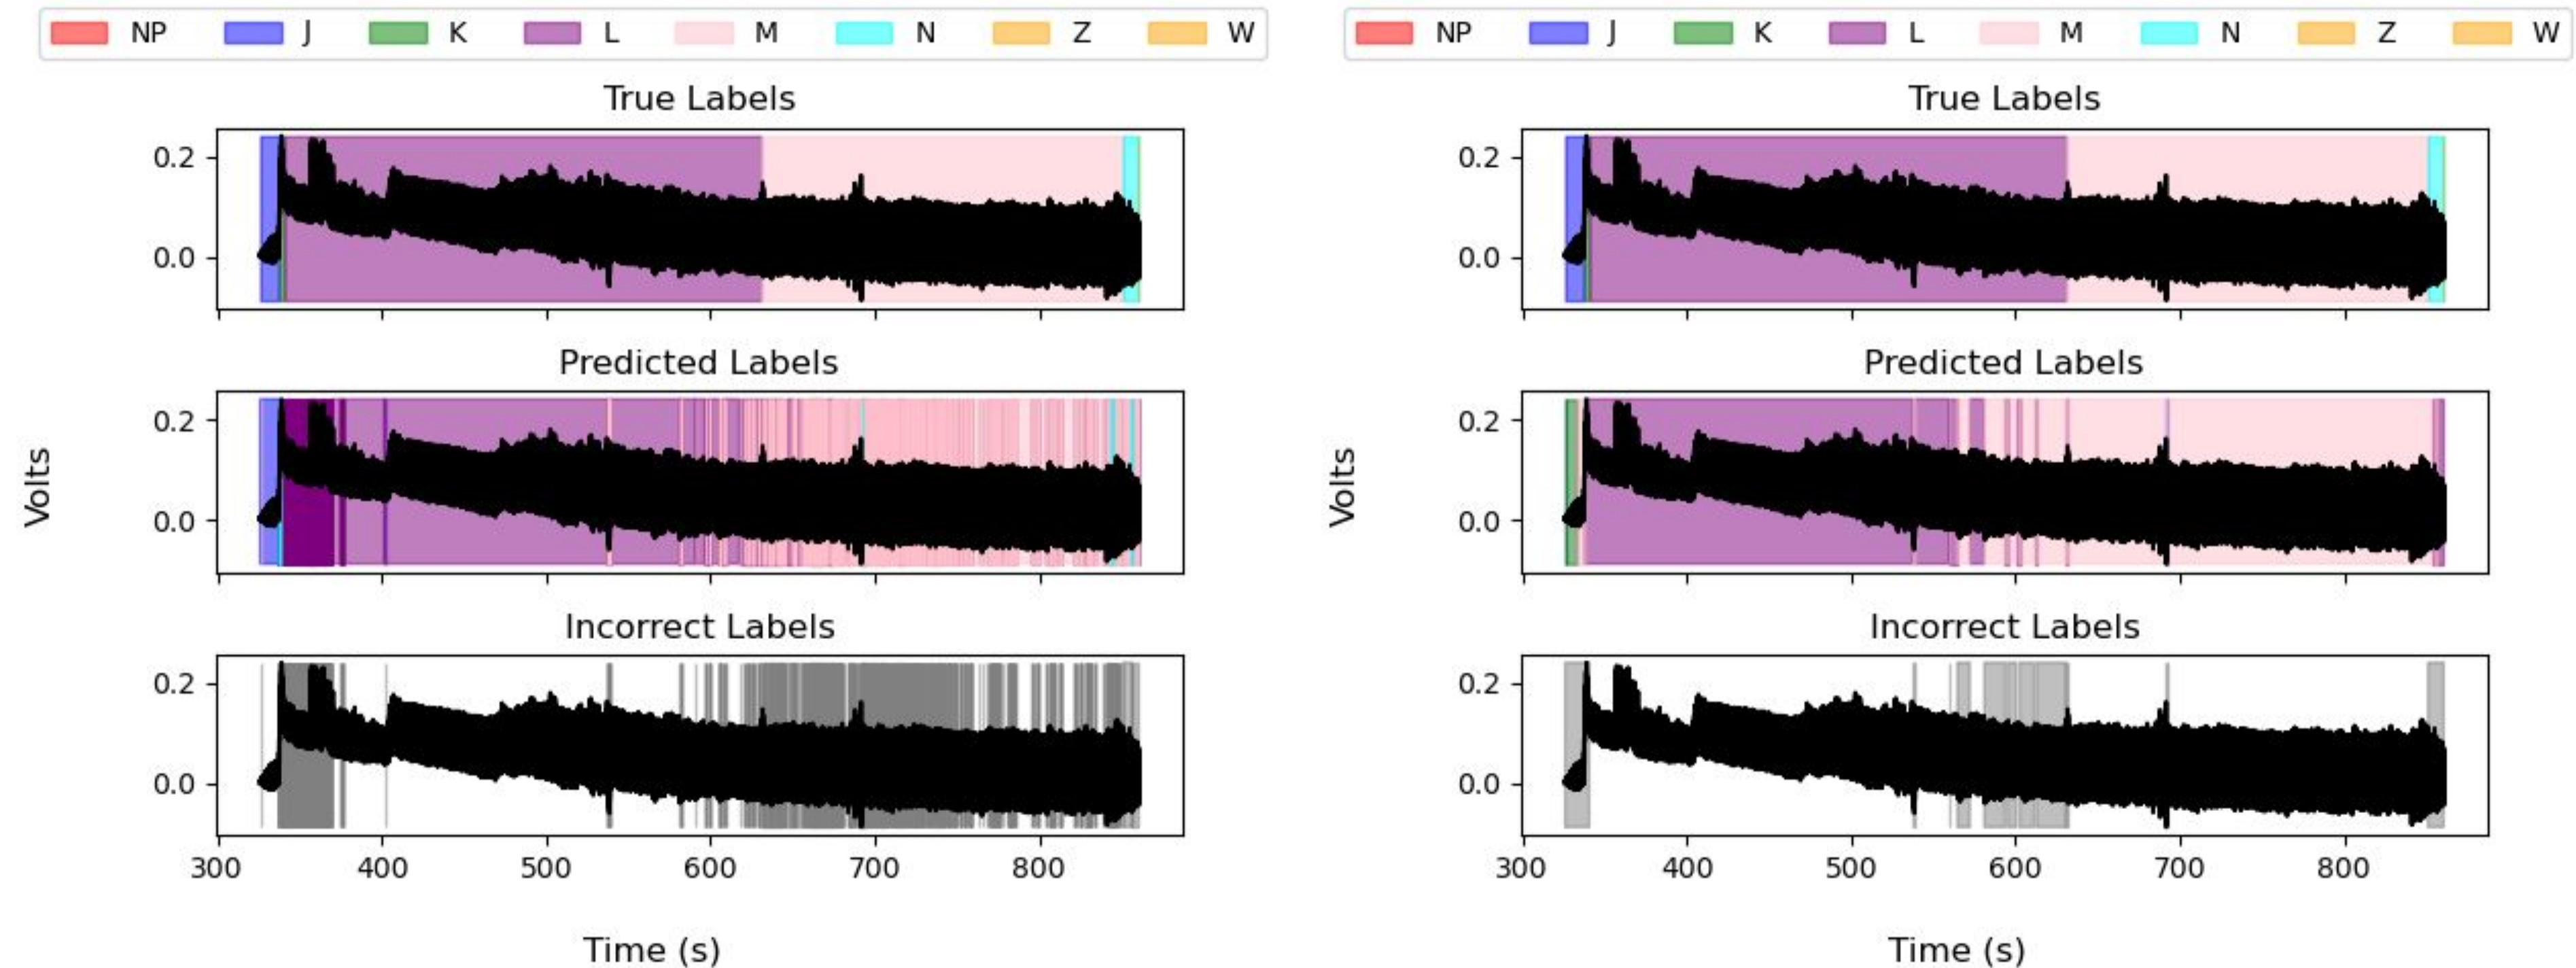

# Post Processing

- Problem: “Barcodes”
- Solutions
  - Smoothing filter
  - Barcode cutter
  - HMM
  - HSMM
- Project for next interns

# Example: HMM Postprocessor

---

# Limitations

- Liaisons are experts in biology but not computer science
- Model output is never perfect, needs some manual adjustment
- Important to convey system limitations
  - Potential for negative impact on science if blindly trusted

---

# Future Work

- User Interface
  - Make more comprehensive by integrating live view
  - Render long recordings more efficiently
  - Integrate post-processing
- Machine Learning
  - Other post-processing and data augmentation methods
  - Adapt models for other insects

# Thank you!

Questions/comments/suggestions?

We'd love to touch on ML models we've tried or the project's future!
